

# IN15 Upgrade

Péter Falus, Béla Farago

Std solenoid:

1m long ( centered at zero), 6 cm radius 150 turns.

In20 coils:

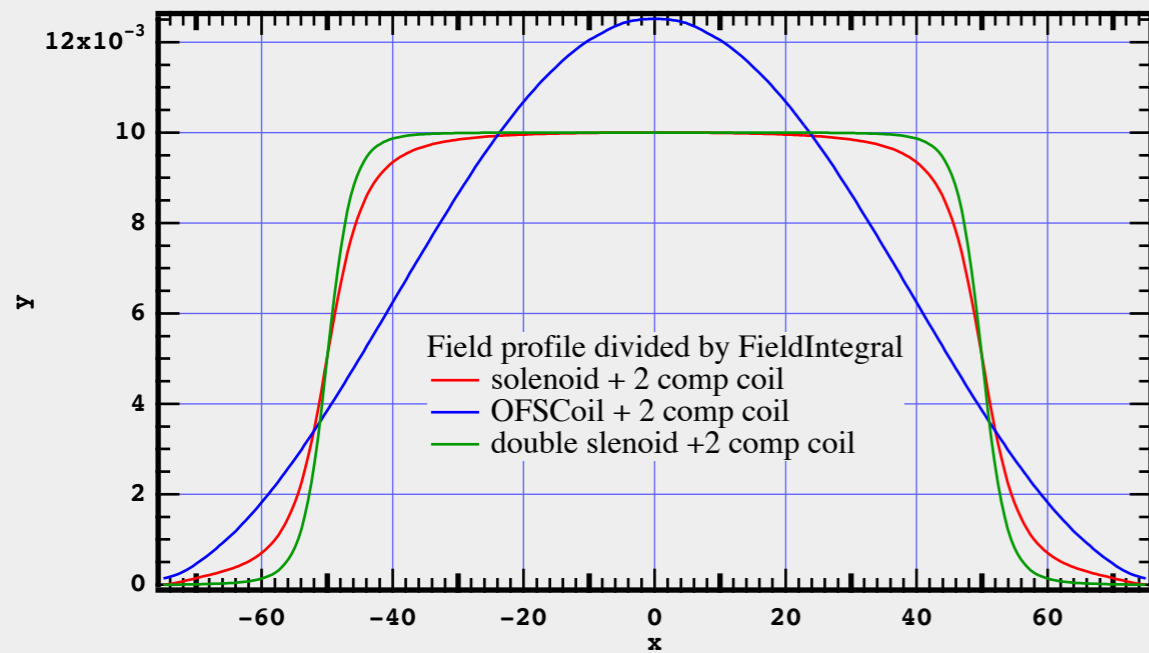

1.41m => 0.13m long 29(!) layers, 4 cm radius.

compensated solenoids:

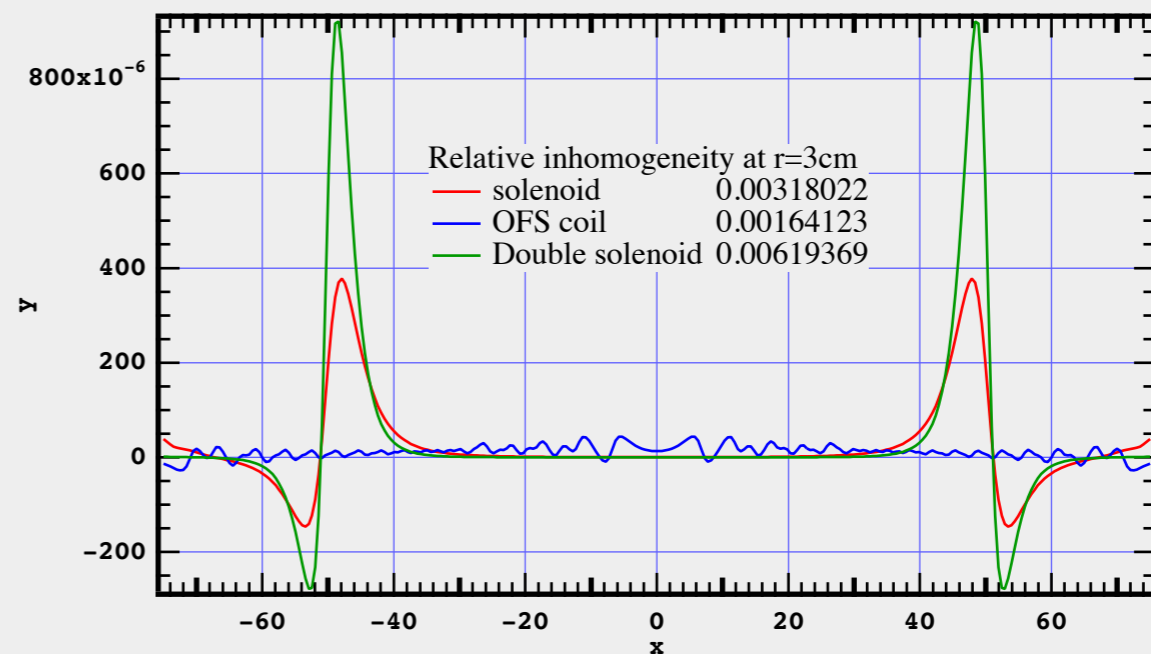

1m long  $r_{in}=5$  cm  $r_{out}=7$  cm radius 150 turns  $I_{out} \sim 0.5 \cdot I_{in}$  ensuring  
zero dipole moment.

for all configurations there were 2 coils 6 cm radius at + and- 75 cm  
which brings down the field to zero ( needed for  $\pi$  or  $\pi/2$  flipper  
operation )

$$\Delta \int B dz \cong \frac{r^2}{8} \int \frac{1}{B(z)} \left( \frac{\partial B(z)}{\partial z} \right)^2 dz$$

$$B^2 V^2 = P m$$

# IN15 2014

The measured quantity is:  $S(q,t)/S(q,0)$  where:

Echo condition:

$$\int_{\pi/2}^{\pi} B_1 d\ell = \int_{\pi}^{\pi/2} B_2 d\ell$$

100,000  
turns

$>10^{-6}$  precision

$$\text{Gain} = 1/t = IP^2 R^2 \text{ (@500ns)}$$

### Major IN15 upgrades

Polarizer  $I \times 11$

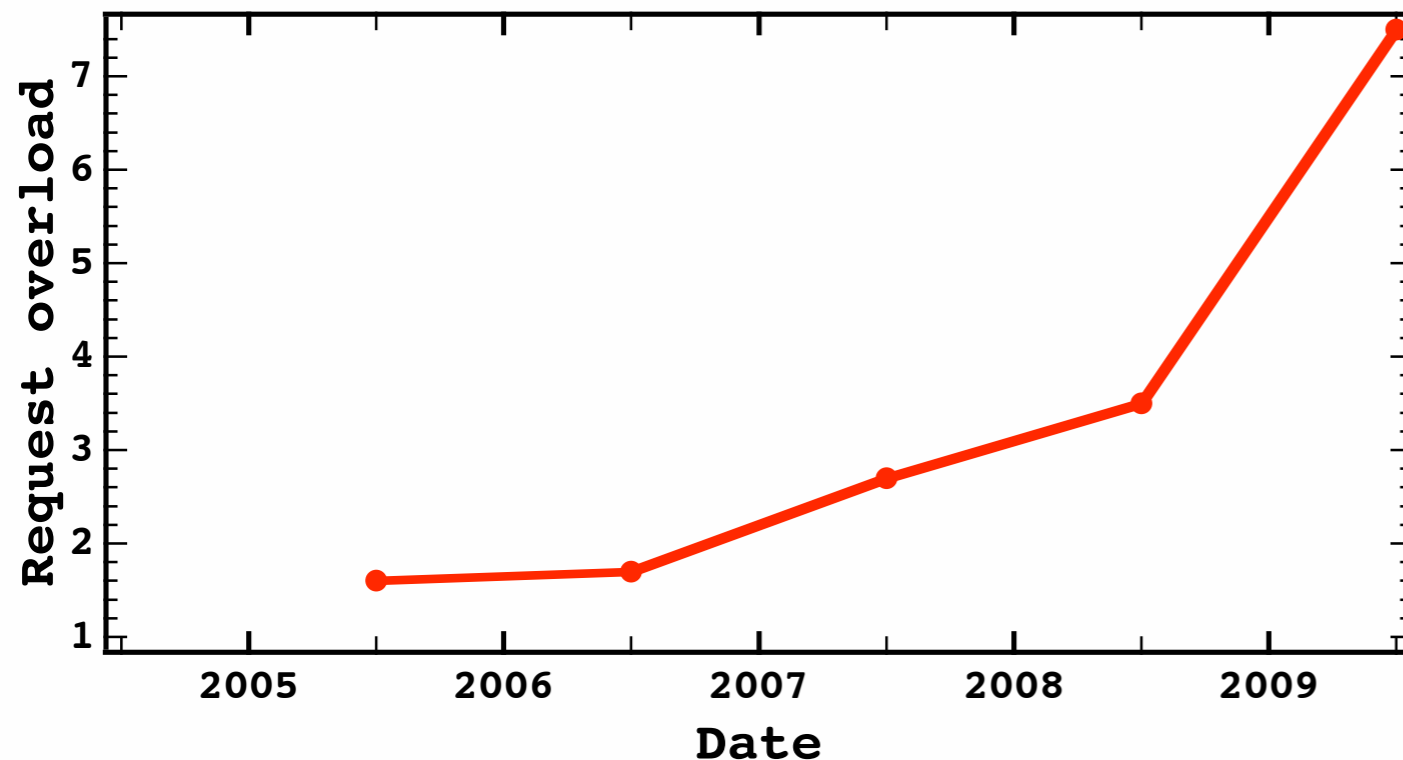

Power supply  $R^2 \times 2$

Al Fresnel  $I \times 2$

Repolarizer  $IP^2 \times 1.7$

Precession coils  $I \times 10$

Coincidence ?

$$\int B(r,z) dz = \int B(0,z) dz + \frac{r^2}{8} \int \frac{1}{B(0,z)} \left( \frac{dB(0,z)}{dz} \right)^2 dz$$

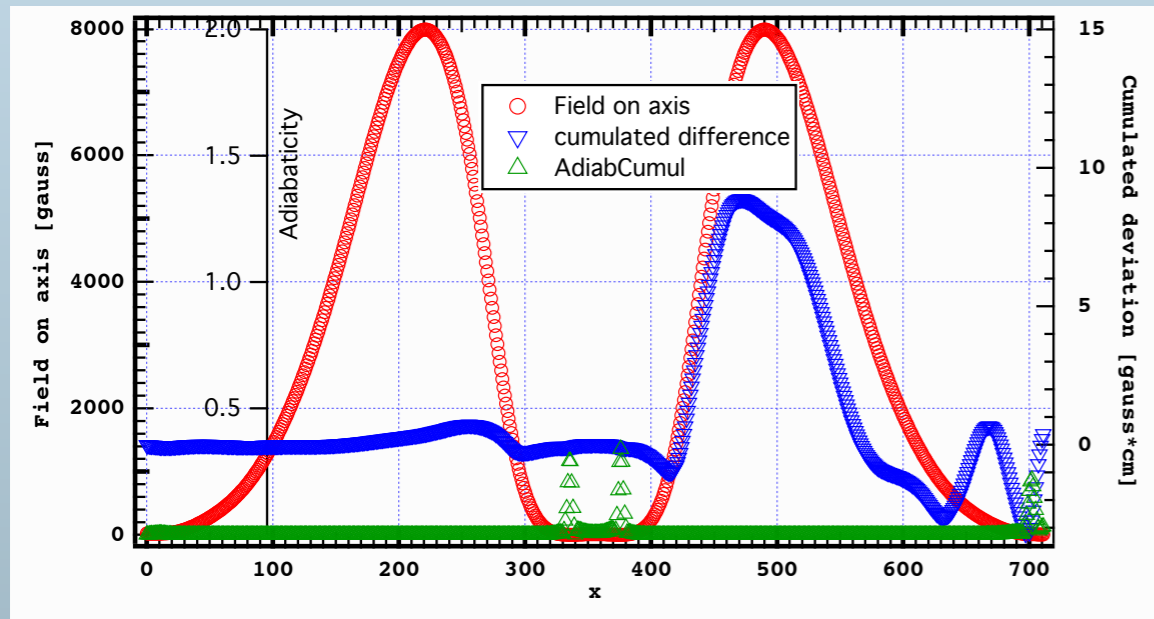

$$\Delta = \int_1 B dl - \int_2 B dl$$

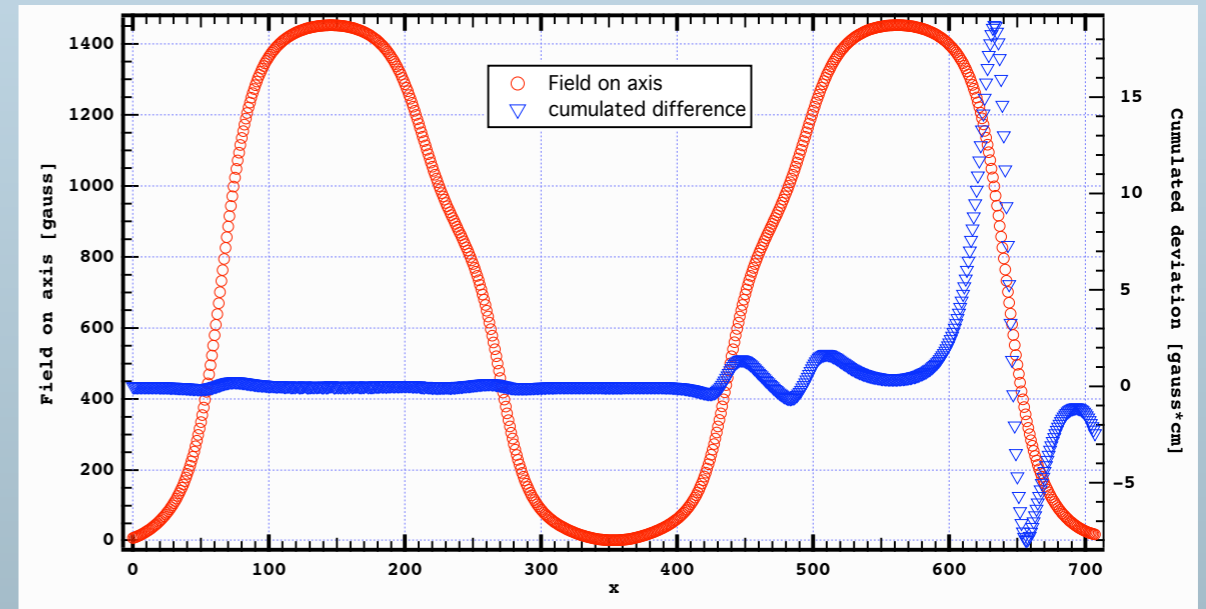

Std dev 269 Gauss cm

$$\langle B(r) - B(0) \rangle$$

Std dev  
569 Gauss cm

Std dev  
269 Gauss cm  
(4x upscale = 1345)

# IN15 2015

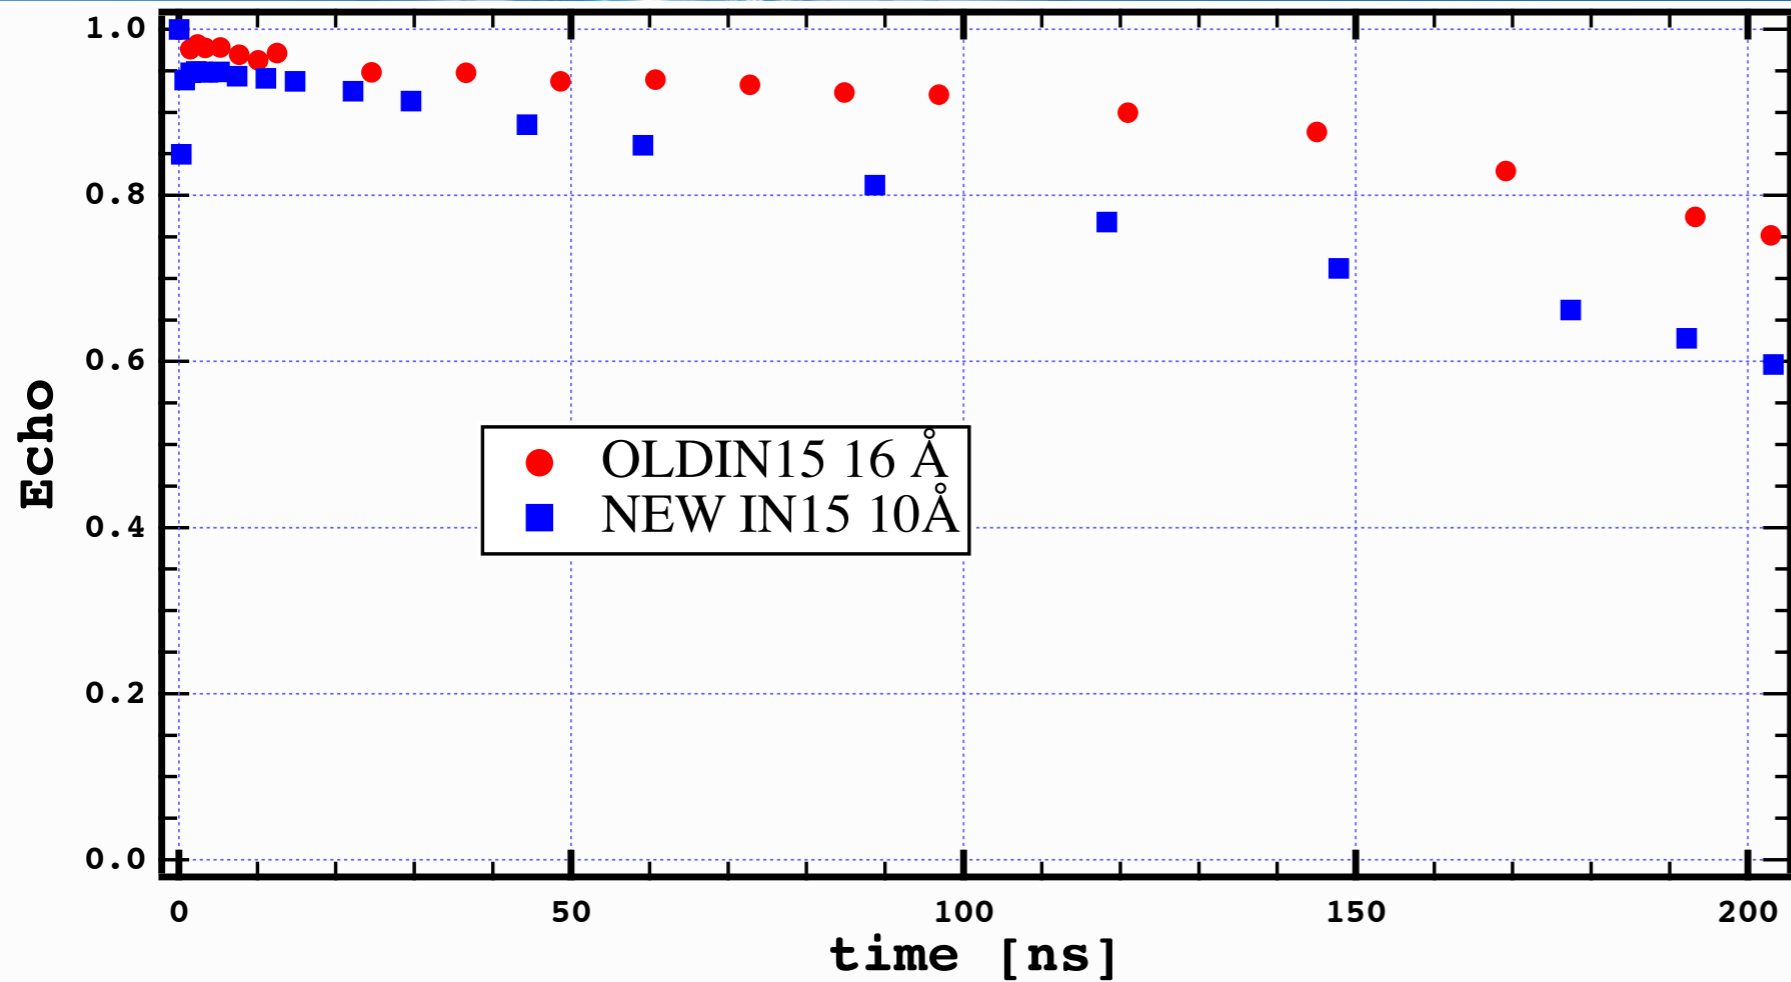

# IN15 2016

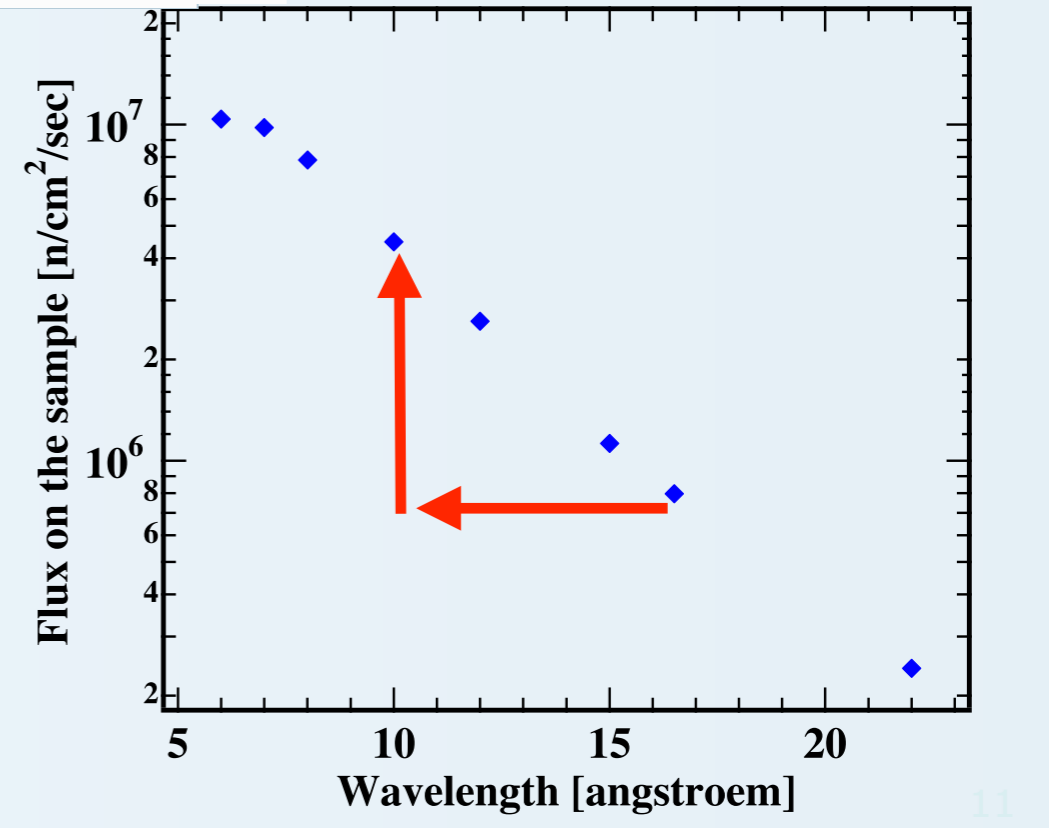

# IN15 upgrade

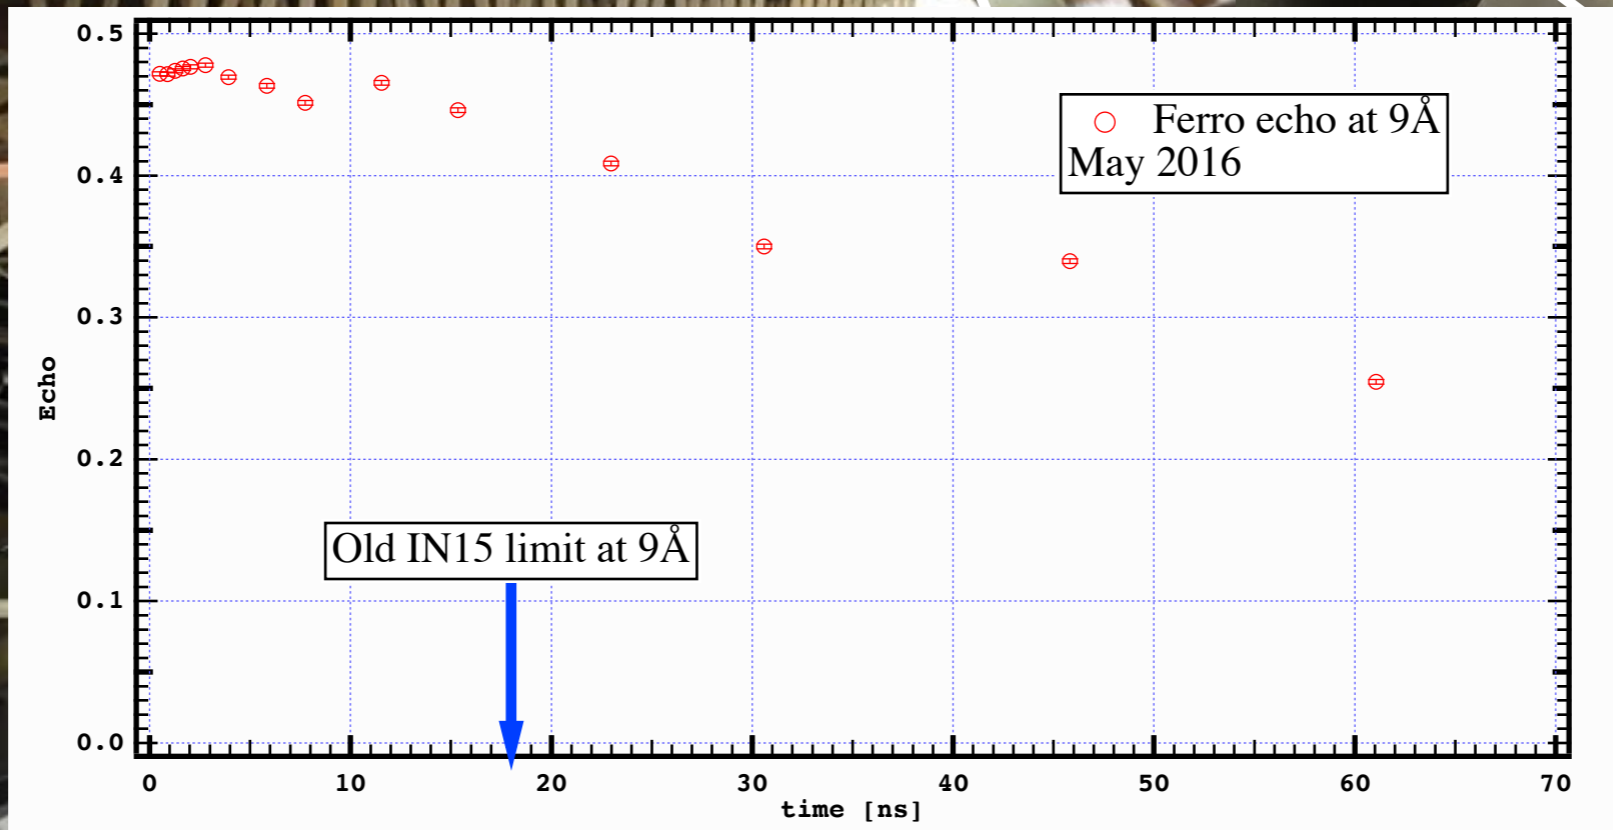

$$t \propto \lambda^3 \int B dl$$
$$I \propto \lambda^{-5}$$

4 x higher field integral  
==  
1/1.6 x shorter wavelength  
==  
10 x higher intensity!

# IN15 Projects

Sample changer ?

# Small echo

Using the same removable flippers shortest to longest times scale extended from 1:1000 to 1:10000

Very compact coils no need to dismount them
