WASP: a replacement for IN11

- NSE spectrometers can cover a huge dynamic window
- With the construction of IN15, ILL could offer two spectrometers, each with a specialisation:
- IN15: maximum spin-echo time, low Q
- IN11: maximum Q, moderate spin-echo time

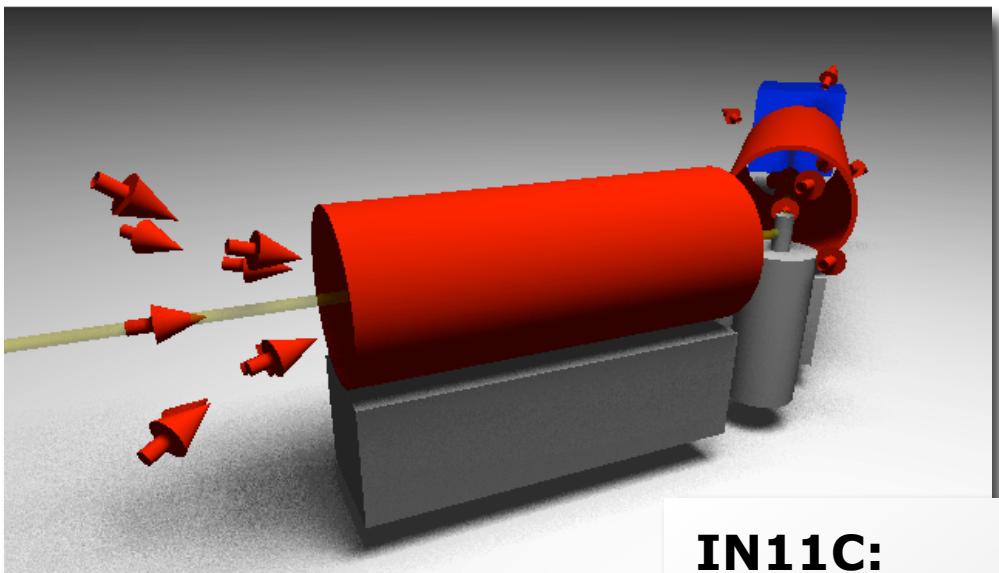

$$Q = \frac{4\pi}{\lambda} \sin \theta$$

$$t \propto \lambda^3 \int B \cdot dl$$

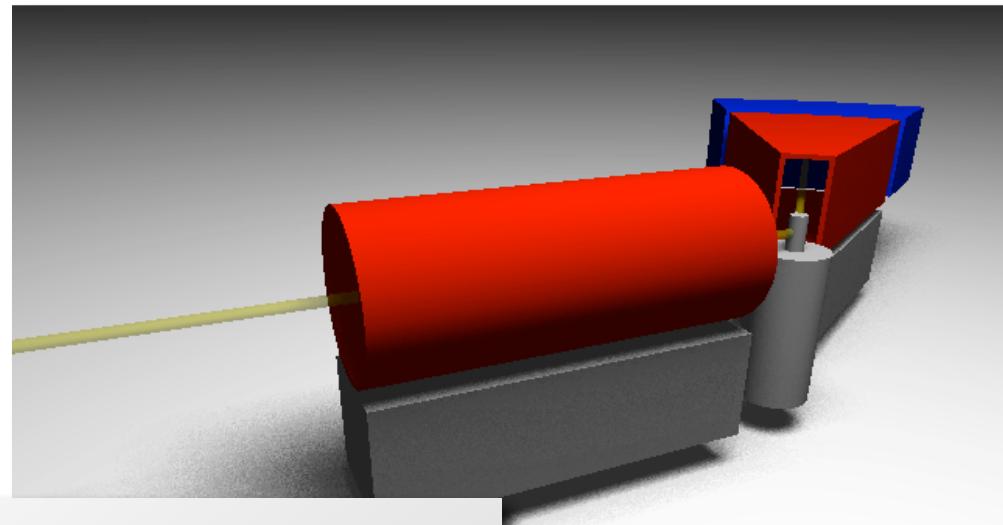

Large detector coverage essential for high Q

IN11A - high resolution

IN11C - 30° detector bank

IN11C:

- 30 detector coverage
- **Increases** the detection solid angle x20
- **Reduces** maximum spin-echo time /6

New spin-echo concept: SPAN @ HZB, Berlin

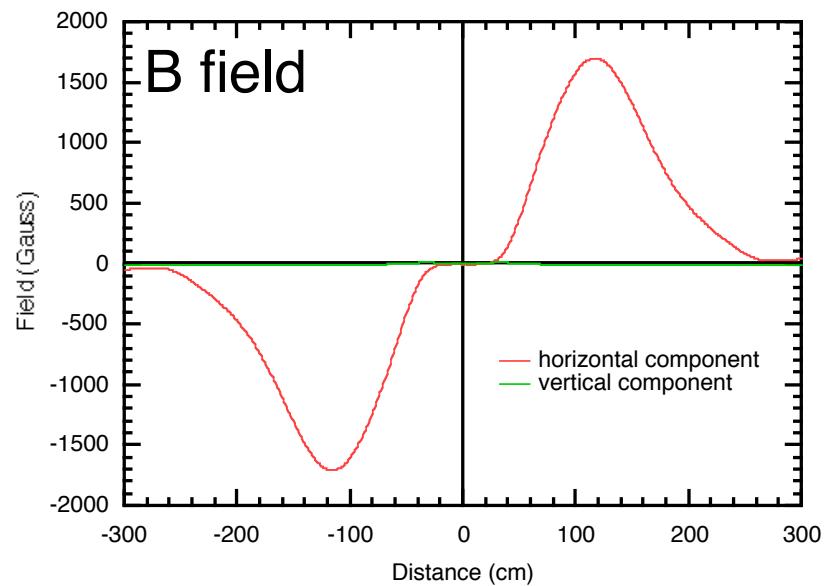

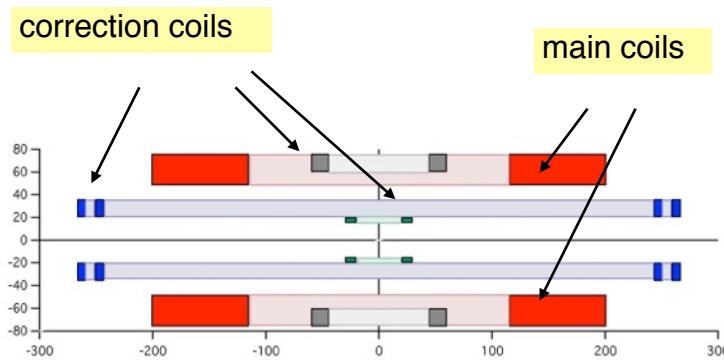

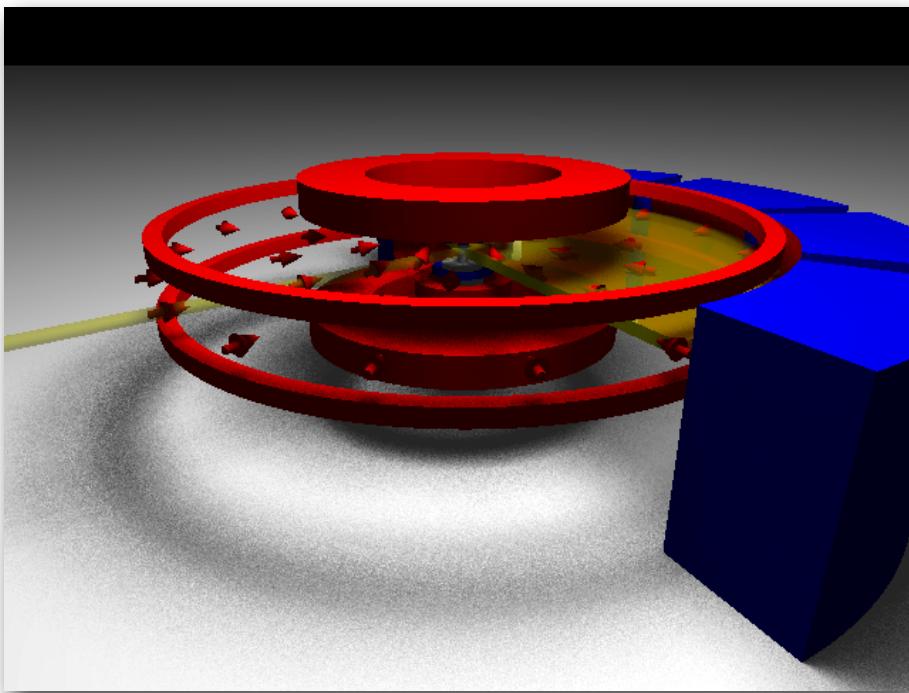

SPAN:

- collinear solenoids are replaced by anti-Helmholtz set-up
- magnetic field is symmetric to sample position in scattering plane

layout and fields

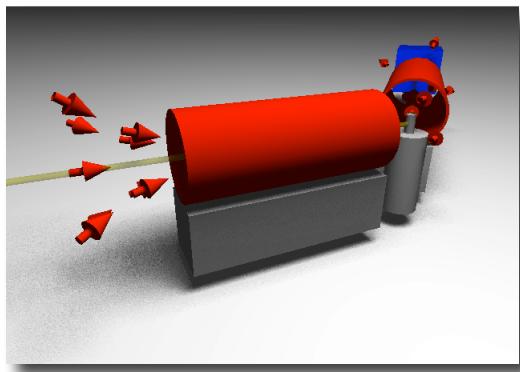

WASP wide angle spin-echo spectrometer

layout and fields

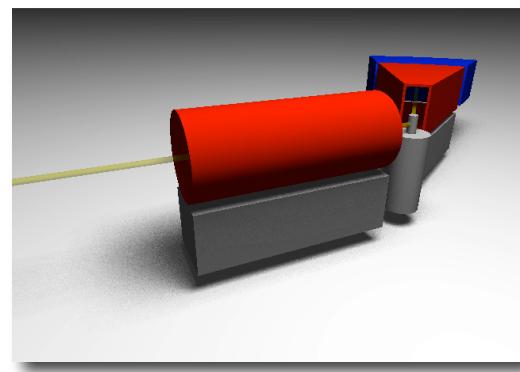

evolution towards WASP

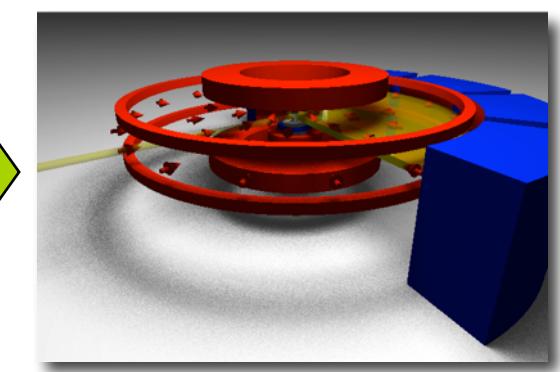

IN11A - high resol.

IN11C - 30° detector bank

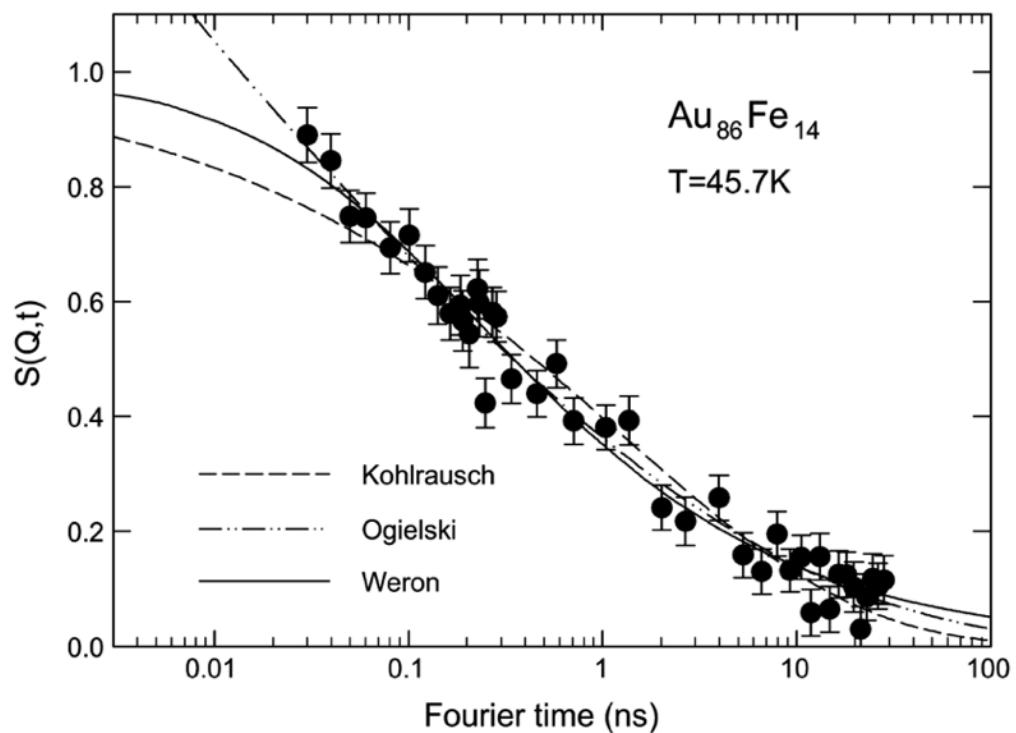

WASP

WASP will:

- Provide same **high resolution** as IN11A
- Increase the **sample flux x5-8**
- Increase the **detection solid angle > x6** (compared to IN11C)

Scientific Case for IN11/WASP: Examples

*Determination of
relaxation lineshape*

Limited by **statistics** and
spectroscopic range

A wide-angle photograph of a mountainous landscape. In the foreground, there's a rocky, grassy slope leading down towards a bright turquoise lake nestled in a valley. To the left, a prominent dark grey mountain peak rises, featuring a small, dark, rectangular structure on its side. The background consists of a range of mountains under a clear, vibrant blue sky.

Thank You!
